

Generators 101: HOW IT WORKS

KOHLER[®]
IN POWER. SINCE 1920.

Titanium Dealer

AIR & ENERGY
Air • Plumbing • Electrical • Generators

1. Before the power goes out

Your automatic transfer switch (ATS) monitors the electricity coming from the utility. It's working 24/7 to protect your home.

2. The power goes out

When the power fails or drops below an acceptable level (brownout), the ATS signals the generator to start. In seconds, the ATS transfers your power from the utility to the generator.

3. Your generator powers your home

The generator supplies your home or business with electricity until the utility power is restored.

4. The utility power returns

When the utility power is restored, the ATS automatically transfers your power source from the generator to the utility.

5. Your generator turns off

Your KOHLER[®] generator automatically shuts down, ready for the next power outage.
